1 Summary

VRChat Tracker is a virtual reality social platform assistant tool that allows users to access certain features of VRChat on their mobile devices. With the app, users can check their friends' status, discover worlds and avatars, and view their own profile. This solves the problem of users being unable to access these features while away from their desktop or VR headset. The app fits into the App Store landscape as a companion app for a popular virtual reality social platform. The app is not designed for private company use, but rather a student project from UChicago. The app uses the official VRChat API to fetch data, ensuring that users have access to the most up-to-date information.
